

METHOD AND SYSTEM FOR PROVIDING AT HOME HEALTH CARE SERVICE**ABSTRACT**

A method for in-home monitoring which monitors at least one behavioral parameter associated with a person. The behavioral parameter can be compared to at least one pre-determined rule which is based upon a behavioral profile. The data representing the behavioral parameter can be forwarded from a sensing device (102) to a device interface (104) of a server (101) within the person's home. In one arrangement, the data can be wirelessly propagated to the device interface. An exception can be triggered if the behavioral parameter does not match the behavioral profile. The exception can be forwarded to a monitoring server (180) located outside the home and at least one action responsive to the exception can be initiated.
